DENTAL SEALANTS

Dental sealants are a very thin plastic film applied to deep pits and grooves of molars and premolars. Sealants can prevent tooth decay in these very susceptible areas. Dental sealants have been studied for more than 20 years and have been found to be highly effective in preventing cavities, according to an article in the February 2006 issue of AGD Impact, the Academy of General Dentistry's (AGD) monthly news magazine.

After placement of sealants:

1. DO NOT eat sticky items like
 - a. Taffy
 - b. Sticky gum
 - c. Hard candies
2. Continue to brush teeth as normal
3. If sealant falls off within the first year we will replace at no charge
